2 Introduction

2.1 Purpose and Scope

Purpose

This Software Requirements Specification (SRS) defines the functional and non-functional requirements of SmartLib Booking, a web-based study-room reservation system for a university library. It serves as a reference for the development team and stakeholders during system design, implementation, testing, and evaluation.

Scope

SmartLib Booking streamlines library room reservations by replacing manual Google Sheets scheduling with an integrated web application.

The system allows students to search for rooms, submit and manage reservations, and receive email notifications. Librarians can manage room inventories, handle booking requests manually, or enable automatic first-come-first-served (FCFS) approval. An optional locally hosted AI assistant supports natural-language room searches and floor-plan inquiries.

The system is designed for a single university library and is accessible through modern web browsers on desktop and mobile devices.

The following are outside the project scope:

- Online payments and fee or fine settlement.
- Native mobile applications.
- Multi-library or multi-campus support.
- Cloud-hosted AI services.

Intended Readers

This document is intended for the project sponsor (course instructor and teaching assistant), development team, students, librarians, and library management. It helps the development team implement and test the system while enabling stakeholders to understand its capabilities and limitations.

2.2 Glossary

Term	Definition
SmartLib Booking	A web-based study-room reservation system for a single university library.
SRS	Software Requirements Specification; a document defining software requirements and constraints.
Student	A user who searches for rooms and manages reservations.
Librarian	A staff member who manages room inventories and reservation requests.
Room Inventory	The collection of room profiles and their attributes, such as capacity, location, and equipment.
Reservation	A request to use a study room during a specified time slot.
Booking Conflict	An overlap between a requested time slot and an existing reservation for the same room.
Manual Review Mode	A workflow in which librarians review and approve reservation requests.
FCFS (First-Come-First-Served)	An approval mode that automatically approves valid, conflict-free requests in arrival order.
Email Notification	An email informing users of reservation events, such as submission, approval, or cancellation.
AI Assistant	An optional tool for natural-language room searches and floor-plan inquiries.
VLM (Vision-Language Model)	An AI model that processes visual information and natural-language input.
Authentication	The process of verifying a user's identity before granting system access.
Single-Tenant System	A system designed to serve one library organization.

3 Problem Statement

3.1. Business Context

The increasing demand for study rooms, group discussion areas, and quiet study spaces in university libraries creates a need for an efficient reservation management system. Currently, the room booking process relies heavily on manual operations, making it difficult for students and library staff to manage reservations effectively.

SmartLib Booking is proposed as a web-based room reservation system for a single university library. It aims to simplify the booking process, reduce administrative workload, and improve the overall efficiency of room management.

3.2. Current Problems

The existing reservation process requires students to submit booking requests and librarians manually review requests and update room schedules using a shared Google Sheet. This approach presents several challenges:

- Time-consuming procedures: Manual verification and approval can delay booking confirmations, particularly during periods of high demand.
- Scheduling conflicts: Manually maintained schedules are prone to human errors, potentially resulting in overlapping reservations.
- Limited availability visibility: Students cannot easily check room availability, capacity, equipment, or booking status through a centralized interface.
- Administrative workload: Librarians must manually manage reservations, update room information, and handle schedule changes or cancellations.

These limitations reduce the efficiency and reliability of the current reservation process.

3.3. Goals

SmartLib Booking aims to replace the existing manual workflow with a centralized and automated reservation system.

The system will allow students to search for available rooms based on date, time, capacity, location, and equipment; submit reservation requests; and view, cancel, or reschedule their bookings.

Librarians will be able to manage room profiles, configure maintenance periods, and review booking requests. The system will support both manual approval and an optional first-come-first-served automatic approval mode, with conflict detection to prevent overlapping reservations.

Additional features include automated email notifications for booking status updates and an optional AI assistant powered by a locally hosted Vision-Language Model (VLM) to support natural-language room searches, floor-plan inquiries, and booking assistance.

3.4. Operating Environment

SmartLib Booking will operate as a web application accessible through modern browsers, including Chrome, Safari, Firefox, and Edge, on desktop and mobile devices with an internet connection.

The backend will run on a Python-based web server using Django, while PostgreSQL will manage reservation and room data. The production database will be hosted on Supabase Cloud, and local development will use Docker containers.

The optional AI assistant will operate through a locally hosted VLM service on a librarian's workstation, connected to the main application through an API.

3.5. Design and Implementation Constraints

The system must comply with the following constraints:

- Technology constraints: The application will use Python and Django for the backend, Django Templates and Tailwind CSS for the frontend, and PostgreSQL for data storage.
- Authentication and authorization: Users must authenticate with valid student or staff credentials, and system operations must respect their assigned roles.
- Booking policies: Reservations must follow library rules, including a maximum of 8 booking hours per week, 4 hours per day, and 4 hours per session. Bookings must occur within official operating hours, avoid overlapping reservations, and respect room maintenance periods.
- Deployment constraints: The system is designed for a single university library and will be delivered exclusively as a web application.
- AI resource constraints: The optional VLM must run locally within the available GPU and RAM capacity of staff workstations, without relying on cloud-hosted AI services.
- Scope limitations: Native mobile applications, multi-library or multi-campus management, online payments, and fine settlement systems are excluded from the project scope.

4 Stakeholders

#	Stakeholder	Description	Interests / concerns
1	Project sponsor (course instructor & TA)	Evaluate the project, the team's teamwork and the development process.	A complete, well-documented product that meets the PA requirements. Traceability from requirements to use cases, design and tests (Section 9). Correct use of tools and full disclosure of AI use under the course GenAI policy.
2	Student (end user)	University students who book rooms for individual or group study. Primary actor of UC-02, UC-03, UC-05, UC-06 and UC-10 (use case with "must" priority)	Finding available rooms and their equipment quickly (UC-02). Booking with fast feedback, and instant approval when auto-approval is on (UC-03, UC-12). Viewing, cancelling and rescheduling their own bookings (UC-05, UC-06, UC-10). Email notices on submission, approval and cancellation (UC-13). Clear, fair booking limits of 4 hours per day and 8 hours per week (BR-01, BR-02). No double bookings once a booking is confirmed (BR-05). Being told promptly if the library cancels a booking for maintenance (BR-06). Optional natural-language room search (UC-14 to UC-16).
3	Librarian / library staff (end user)	Staff who manage rooms and process booking requests. Primary actor of UC-07, UC-08, UC-09 and UC-11 (use case with "must" priority)	Managing room profiles and maintenance status without manual tracking (UC-08, UC-09). Reviewing requests in one queue (UC-07). Turning auto-approval on or off at peak times (UC-11). No double bookings (BR-05) and less work than the Google Docs and Google Sheets process. A dashboard that feels like the familiar spreadsheet layout (risk R5 in PA1). An AI assistant that runs on a staff workstation without slowing it down or crashing it.

4	Library management	Decision makers responsible for library services and policies. They are not a system actor and do not use the system directly.	Setting the booking policies the system must enforce: weekly and daily limits, required booking information, and the maintenance override (BR-01, BR-02, BR-03, BR-06). Operating hours as defined in the library schedule (BR-04). Better room use, fewer scheduling conflicts, lower staff workload and low operating cost (free-tier hosting, no cloud AI fees).
5	Development team (TPNSM)	Five students who analyse, design, build, test and deploy the system.	A feasible scope and a manageable workload (about 3.5 to 4.5 hours per member per week). A working demo for the final presentation. A target grade of 9.0 or higher. Keeping to the 11-week schedule by building the Must-have features first (risks R3 and R4 in PA1).

5 Requirements

5.1 Functional Requirements

ID	Requirement	Feature	Priority	Source
FR-01	The system shall authenticate students and librarians using university credentials and enforce role-based access.	Login	Must	Document
FR-02	The system shall allow users to search for available rooms by date, time slot, capacity, and attributes.	Room Search	Must	Document
FR-03	The system shall allow students to submit room bookings with the required information and receive booking confirmation by email.	Room Booking	Must	Document
FR-04	The system shall check for overlapping bookings and room maintenance periods before confirming a booking.	Conflict Checking	Must	Document
FR-05	The system shall display students' past, current, and cancelled bookings with their details.	Booking Management	Must	Document
FR-06	The system shall allow students to cancel their own upcoming pending or approved bookings and release the reserved time slot.	Booking Management	Must	Document

FR-07	The system shall allow librarians to review pending booking requests and approve or reject them.	Booking Approval	Must	Stakeholder
FR-08	The system shall allow librarians to add, edit, and disable room profiles.	Room Inventory	Must	Stakeholder
FR-09	The system shall allow librarians to set room maintenance periods and cancel affected bookings.	Room Maintenance	Must	Document
FR-10	The system shall allow students to reschedule bookings.	Booking Management	Should	Document
FR-11	The system shall allow librarians to enable or disable automatic booking approval.	Auto-Approval	Should	Document
FR-12	The system shall automatically approve booking requests when automatic approval is enabled.	Auto-Approval	Should	Document
FR-13	The system shall send email notifications for booking-related events.	Notifications	Should	Document
FR-14	The system shall allow users to search for rooms using natural-language queries.	AI Assistant	Should	Document
FR-15	The system shall allow users to ask questions about library floor plans.	AI Assistant	Should	Document

FR-16	The system shall allow students to book rooms through the AI assistant.	AI Assistant	Should	Document

5.2 Non-Functional Requirements

ID	Category	Requirement (measurable)	How it will be verified
NFR-01	Performance	Authentication latency shall be under 500 ms.	Measure authentication latency.
NFR-02	Performance	Room-search queries shall return results within 1 second under normal server load.	Measure search response time under normal server load.
NFR-03	Performance	Booking-conflict checks shall execute within 100 ms.	Measure conflict-check execution time.
NFR-04	Performance	The My Bookings page shall load within 1 second.	Measure page-load time.
NFR-05	Performance	Released booking slots shall be reflected in the search index synchronously within 1 second after cancellation.	Measure the time until the cancelled slot becomes available in search.
NFR-06	Reliability	Booking transactions shall enforce database atomicity.	Test booking transactions and verify that failures do not leave partial transaction changes.
NFR-07	Consistency	Administrative booking-queue updates shall be reflected in real time.	Observe the booking queue after a request is processed.
NFR-08	Consistency	Room-profile updates shall take immediate effect across search endpoints.	Update a room profile and verify the resulting search data.
NFR-09	Performance	Maintenance-related cancellation emails shall be queued within 1 hour.	Compare booking-cancellation timestamps with email-queue timestamps.

5.3 Domain Requirements and Business Rules

ID	Rule	Source (policy, law, standard)
BR-01	**Weekly Student Quota Limit** Each student group or student ID is allowed to book a maximum cumulative total of 8 hours per calendar week.	Library Management Policy
BR-02	**Daily & Single-Session Duration Limits** A student group is restricted to a maximum reservation of 4 hours per session, and no more than 4 hours per day.	Library Management Policy
BR-03	**Mandatory Booking Information Requirements** Require every booking submission must provide the following data fields: (1) Booking Start & End Time, (2) Representative Student ID, (3) Total Member Count, and (4) Individual Student IDs of all group members. If any of these details are missing, the system shall reject or automatically cancel the booking request.	Library Management Policy
BR-04	**Operating Hours & Slot Validity** Rooms can only be reserved during official operational time slots.	Library Schedule Calendar
BR-05	**Conflict Prevention (No Double-Booking)** No study room can be reserved for overlapping time intervals. The system must enforce time-slot conflict checks (invoking *UC-04: Check Booking Conflict*) before confirming any reservation.	Software Specification Requirement
BR-06	**Maintenance Overriding Rule** When a Librarian sets a room to "Under Maintenance" (UC-09), all pending or approved reservations falling within the maintenance timeframe must be automatically cancelled and notifications dispatched.	Library Management Policy

5.4 Acceptance Criteria

Acceptance Criteria for F01: Basic Room Booking

- AC-F01-01: Successful Room Booking Submission:
    - Given: an authenticated student has not exceeded their daily quota of 4 hours and weekly quota of 8 hours, and a target study room is available for the selected time slot.
    - When: the student selects the room, fills in all mandatory fields (Start/End Time, Representative Student ID, Member Count, and all Group Member Student IDs), and clicks Submit Booking.
    - Then: the system shall create a new booking record with status Pending, and dispatch a confirmation email to the student's registered email address.
- AC-F01-02: Rejection of Overlapping Time Slot Booking (BR-05):
    - Given: a study room already has an approved or pending reservation in working hours on a specific date.
    - When: another student attempts to submit a reservation for the same room from that same time on that date.
    - Then: the system shall invoke UC-04 (Check Booking Conflict) and reject the submission, and display an error message: The selected time slot conflicts with an existing reservation.
- AC-F01-03: Rejection Due to Incomplete Group Information (BR-04):
    - Given: an authenticated student is filling out the room reservation form.
    - When: the student attempts to submit the form without providing the list of individual group member Student IDs.
    - Then: the system shall block the form submission, and highlight the missing fields and show the error.
- AC-F01-04: Rejection Due to Exceeding Duration Quotas (BR-01 & BR-02):
    - Given: a student has already accumulated 6 hours of approved room bookings in the current calendar week.

- When: the student attempts to book a new session for 4 continuous hours result in 10 hour in this week.
- Then: the system shall validate the request against quota rules and prevent order placement, and display an alert (Weekly booking limit exceeded).

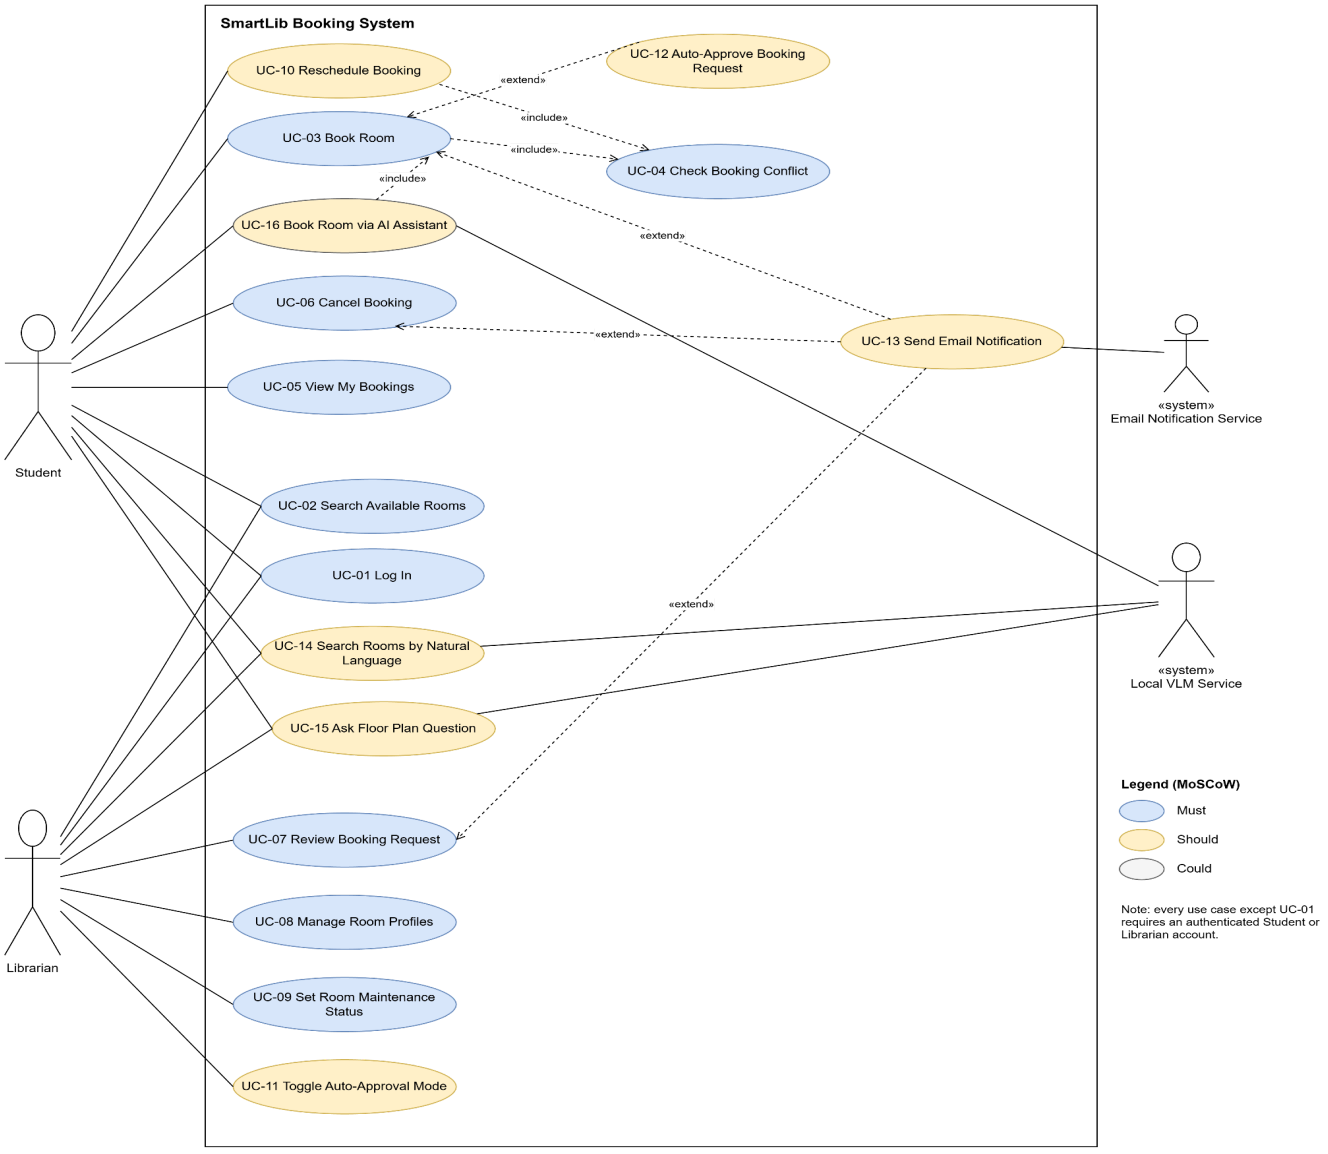

- AC-F01-05: Successful Booking Cancellation:
  - Given: a student has an upcoming reservation in Pending or Approved state scheduled to start in 2 hours.
  - When: the student views My Booking and clicks the Cancel Booking button.
  - Then: the system shall update the booking status to Cancelled, and immediately release the reserved time slot back to the public availability calendar.

Acceptance Criteria for F02: Room Inventory Management

- AC-F02-01: Adding a New Operational Room Profile:
  - Given: an authenticated Librarian is accessing the Room Inventory Management.
  - When: the Librarian inputs a unique Room ID, Capacity, Floor Location, and Available Amenities, and clicks Save Profile.
  - Then the system shall create the new room record in the database, and make the room immediately shown and searchable in the student booking interface.
- AC-F02-02: Setting Room Maintenance Status Overriding Existing Bookings (BR-06):
  - Given: a study room has an active approved student booking for tomorrow between 13:00 and 15:00.
  - When: a Librarian sets that room's status to Under Maintenance covering tomorrow's operational hours.
  - Then: the system shall flag the room as unavailable for search, and automatically set the student's booking status to Cancelled, and trigger an automated notification email informing the student of the maintenance closure.

6 Use Case Model

6.1 Use Case Diagram

6.2 Actors

Actor	Description
Student	University student (primary actor) who searches for rooms, books them, and views, cancels or reschedules their own bookings.
Librarian	Library staff member (primary actor) who manages room inventory and maintenance status, reviews booking requests and controls the auto-approval switch.
Email Notification Service	External system (secondary actor) that sends emails when a booking is submitted, approved or canceled.
Local VLM Service	External system (secondary actor): the locally hosted Vision-Language Model that handles natural-language and floor-plan questions for the AI assistant.

6.3 Use Case List

ID	Use case	Primary actor	Priority	Related FR
UC-01	Log In	Student, Librarian	Must	FR-01
UC-02	Search Available Rooms	Student, Librarian	Must	FR-02
UC-03	Book Room	Student	Must	FR-03
UC-04	Check Booking Conflict	Student, Librarian (included use case)	Must	FR-04
UC-05	View My Bookings	Student	Must	FR-05
UC-06	Cancel Booking	Student	Must	FR-06
UC-07	Review Booking Request	Librarian	Must	FR-07
UC-08	Manage Room Profiles (add, edit, disable)	Librarian	Must	FR-08
UC-09	Set Room Maintenance Status	Librarian	Must	FR-09
UC-10	Reschedule Booking	Student	Should	FR-10
UC-11	Toggle Auto-Approval Mode	Librarian	Should	FR-11
UC-12	Auto-Approve Booking Request	Student (initiates through UC-03)	Should	FR-12
UC-13	Send Email Notification	Student, Librarian (indirect trigger)	Should	FR-13

UC-14	Search Rooms by Natural Language	Student, Librarian	Should	FR-14
UC-15	Ask Floor Plan Question	Student, Librarian	Should	FR-15
UC-16	Book Room via AI Assistant	Student	Should	FR-16

7 Use Case Specifications

7.1 Use Case UC-01

Use case ID	UC-01
Use case name	Log In
Brief description	Authenticates a Student or Librarian into the system using university credentials.
Primary actor	Student, Librarian
Secondary actors	Authentication Service.
Priority	Must
Related requirements	FR-01
Trigger	User navigates to the portal and clicks the "Log In" button.
Pre-conditions	User has a valid university account and is not currently logged in.
Post-conditions	An active session token is created, and role-based access control (Student or Librarian) is established.
Main flow	1. User clicks the Log In button on the navigation bar. 2. System displays the Central Authentication Login page. 3. User inputs their ID / Email and Password, then submits the form. 4. System validates the credentials against the user database / identity provider. 5. System retrieves user role permissions (Student or Librarian). 6. System initializes the user session and redirects the user to their respective dashboard.
Alternative flows	None
Exception flows	**E1 (at step 4): Invalid Credentials** 1. System detects wrong ID or password. 2. System displays an error message: "Invalid username or password." 3. Flow returns to step 3.
Business rules	None
Non-functional constraints	Authentication latency shall be under 500ms.

7.2 Use Case UC-02

Use case ID	UC-02
Use case name	Search Available Rooms
Brief description	Allows users to view, and filter library study rooms based on date, time slot, capacity,...
Primary actor	Student, Librarian
Secondary actors	None
Priority	Must
Related requirements	FR-02
Trigger	User accesses the "Find a Room" page.
Pre-conditions	User is authenticated into the system.
Post-conditions	A filtered list of available rooms is displayed.
Main flow	1. User selects the desired booking date, optional filters (room capacity,...). 2. User clicks the "Search" button. 3. System queries existing room schedules. 4. System displays a grid/list of available rooms matching the criteria along with room details. 5. User selects a room card to view detailed availability slots
Alternative flows	A1 (at step 1): Search Without Filters 1. User submits the search without specifying extra criteria. 2. System returns all operational rooms available for the default time slot (current hour).
Exception flows	E1 (at step 3): No Available Rooms 1. The system finds zero matching rooms available for the requested time frame. 2. System renders a notification: "No rooms available for the selected time slot." and suggests alternative nearby time slots.
Business rules	The booking room can only be searched within official library opening hours. (BR-04)
Non-functional constraints	Search queries must return results in ≤ 1s under normal server load.

7.3 Use Case UC-03

Use case ID	UC-03
Use case name	Book Room
Brief description	Allows a student to create a room reservation for a specific time slot .

Primary actor	Student
Secondary actors	Email Notification Service
Priority	Must
Related requirements	FR-03
Trigger	Student selects an available time slot and clicks "Book Now".
Pre-conditions	Student is authenticated and has not exceeded daily quota limits (8 hour/ week, 4 hour/ day)
Post-conditions	A new booking record is created in "Pending" or "Approved" state, reserving the room slot.
Main flow	1. Student selects a room and an available time slot from the search results. 2. Student enters booking purpose and attendee count, then clicks Confirm Booking. 3. System invokes UC-04: Check Booking Conflict to verify slot availability. 4. System validates student quota constraints. 5. System persists the booking record with status "Pending Review" (or "Approved" if auto-approval is ON). 6. System triggers Email Notification Service to send a confirmation mail. 7. System displays booking confirmation to the student.
Alternative flows	A1(at step 5): Auto-Approve Booking 1. System detects that Auto-Approval Mode (UC-11) is active. 2. System sets booking status directly to "Approved".
Exception flows	E1 (at step 3): Conflict Detected 1. UC-04 reports a time slot overlap. 2. System cancels the process and alerts student: "This slot was just booked by another user. Please choose another time." E2 (at step 4): Quota Exceeded 1. System detects student has reached the daily limit of 4 hours a day or 8 hours a week. 2. System displays error: "Daily booking limit reached"
Business rules	BR-01, BR-02, BR-03, BR-04, BR-05
Non-functional constraints	Booking transactions must enforce database atomicity.

7.4 Use Case UC-04

Use case ID	UC-04

Use case name	Check Booking Conflict
Brief description	Validates whether a proposed room booking or reschedule overlaps with any existing approved/pending booking or room is in maintenance.
Primary actor	Student, Librarian
Secondary actors	Database Management System
Priority	Must
Related requirements	FR-04
Trigger	Included automatically by UC-03 (Book Room) or UC-10 (Reschedule Booking)
Pre-conditions	Room ID, proposed Start Time, and End Time.
Post-conditions	Return the conflict condition to the calling parent use case
Main flow	1. System receives Room ID, Start Time, and End Time from the parent flow. 2. System locks room record temporarily to prevent race conditions. 3. System queries the database for existing active bookings for the same Room ID where ProposedStart < ExistingEnd AND ProposedEnd > ExistingStart. 4. System checks if the room has an active "Maintenance" flag set for that period (UC-09). 5. System verifies no time overlap exists and returns Conflict: False to the parent flow.
Alternative flows	None
Exception flows	E1 (at step 5): Overlap Found 1. System identifies an existing booking or maintenance block in the time slot. 2. System returns Conflict: True and details of the conflicting time range to the parent use case.
Business rules	BR-05
Non-functional constraints	Execution time must be ≤ 100ms.

7.5 Use Case UC-05

Use case ID	UC-05
Use case name	View My Bookings
Brief description	Displays a historical and upcoming list of room reservations made by the logged-in student
Primary actor	Student
Secondary actors	None
Priority	Must
Related requirements	FR-05

Trigger	Student clicks "My Bookings" in the account navigation menu.
Pre-conditions	Student is authenticated.
Post-conditions	Current, past, and cancelled reservations are displayed.
Main flow	1. Student selects "My Bookings" menu. 2. System retrieves all booking records associated with the logged-in Student ID. 3. System show bookings into "Upcoming", "Completed", and "Cancelled" tabs. 4. System renders the list showing Room Name, Date, Time Slot, Status, and Action buttons (Cancel/Reschedule). 5. Student clicks a booking card to view complete booking details.
Alternative flows	None
Exception flows	E1 (at step 2): No Bookings Found 1. System finds 0 records for the student. 2. System renders an empty state page with a link: "You have no bookings. Click here to search for a room."
Business rules	BR-03
Non-functional constraints	Page load time ≤ 1s

7.6 Use Case UC-06

Use case ID	UC-06
Use case name	Cancel Booking
Brief description	Allows a student to cancel an upcoming pending or approved room reservation.
Primary actor	Student
Secondary actors	Email Notification Service
Priority	Must
Related requirements	FR-06
Trigger	Student clicks Cancel Booking next to the reservation in My Bookings.
Pre-conditions	Student is authenticated; booking status is Pending or Approved.
Post-conditions	Booking status is updated to "Cancelled", freeing up the room time slot in the calendar.
Main flow	1. Student navigates to "My Bookings" (UC-05) and clicks "Cancel Booking" on an upcoming reservation. 2. System prompts a confirmation form asking for a cancellation reason. 3. Student confirms the cancellation. 4. System updates booking record status to Cancelled in the database. 5. System releases the reserved time slot back.

	6. System invokes Email Notification Service to send a cancellation notice to the student. 7. System updates UI display and shows a success notification.
Alternative flows	None
Exception flows	None
Business rules	None
Non-functional constraints	Slot release in the search index must occur synchronously within 1 second.

7.7 Use Case UC-07

Use case ID	UC-07
Use case name	Review Booking Request
Brief description	Allows a librarian to view pending booking requests and manually approve or reject them.
Primary actor	Librarian.
Secondary actors	Email Notification Service.
Priority	Must.
Related requirements	FR-07
Trigger	Librarian opens the Pending Requests tab in the administrative dashboard.
Pre-conditions	Librarian is logged in; Auto-Approval Mode is turned OFF.
Post-conditions	Booking request state changes to Approved or Rejected with notification dispatched.
Main flow	1. Librarian selects "Pending Booking Requests" from the dashboard menu. 2. System lists all pending requests sorted by submission timestamp. 3. Librarian clicks on a request to view student details, requested room, and purpose. 4. Librarian clicks "Approve". 5. System updates booking status to "Approved". 6. System triggers Email Notification Service to send an approval confirmation email with check-in details to the student. 7. System removes the item from the pending list.
Alternative flows	A1 (at step 4): Reject Request Librarian clicks "Reject" and enters a rejection reason. System updates booking status to Rejected. System triggers Email Notification Service to notify the student with the reason included.

Exception flows	E1 (at step 4): Request Already Processed 1. System detects another librarian approved/rejected the request. 2. System alerts: This request has already been processed, and refreshes list.
Business rules	None
Non-functional constraints	Administrative queue updates must be reflected in real time.

7.8 Use Case UC-08

Use case ID	UC-08
Use case name	Manage Room Profiles
Brief description	Allows a librarian to create, edit, disable, or configure room data(capacity, status, location).
Primary actor	Librarian
Secondary actors	File Storage (for floor plans/photos).
Priority	Must
Related requirements	FR-08
Trigger	Librarian accesses the Room Inventory Management section.
Pre-conditions	Librarian is authenticated with administrative privileges.
Post-conditions	Room profile record is added, updated, or soft-deleted in the database.
Main flow	1. Librarian enters Room Management dashboard. 2. System displays a list of all library study rooms. 3. Librarian clicks Add New Room (or Edit on an existing room). 4. Librarian inputs Room description (Number, Floor, Capacity, Available Equipment (TV, PC, Board), and uploads photo). 5. Librarian clicks Save Profile. 6. System validates room inputs. 7. System saves room data to the database. 8. System displays confirmation message and updates the room list.
Alternative flows	A1 (at step 3): Disable Room Profile 1. Librarian selects "Disable Room". 2. System marks room status as "Inactive" (hides it from student search results without deleting history).
Exception flows	E1 (at step 6): Duplicate Room Number 1. System detects the room number already exists on that floor. 2. System flags the field error: "Room number already exists."

Business rules	Active rooms with future bookings cannot be hard-deleted from the database.
Non-functional constraints	Room profile updates take immediate effect across search endpoints.

7.9 Use Case UC-09

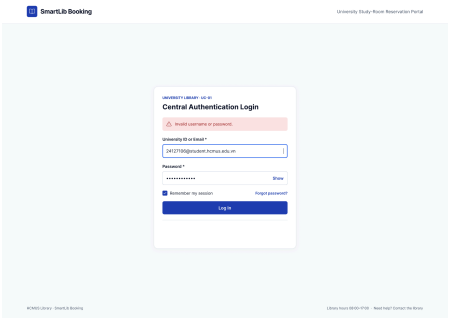

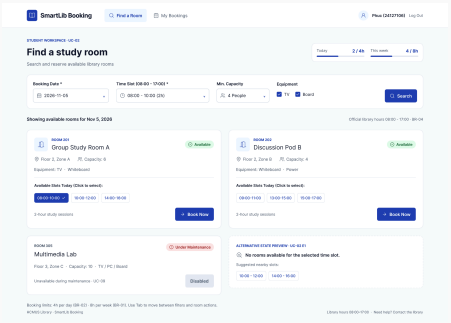

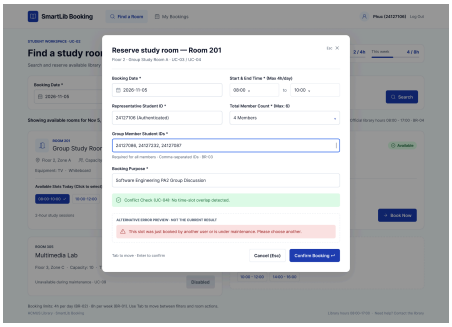

Use case ID	UC-09
Use case name	Set Room Maintenance Status
Brief description	Allows a librarian to mark a room as Under Maintenance (or something else) for a specified date range.
Primary actor	Librarian.
Secondary actors	Email Notification Service
Priority	Must
Related requirements	FR-09
Trigger	Librarian selects Schedule Maintenance on a room profile.
Pre-conditions	Librarian is logged in.
Post-conditions	Room is flagged as unavailable for bookings during the specified maintenance time.
Main flow	1. Librarian selects a room from the inventory list and clicks "Set Maintenance Status". 2. Librarian enters Maintenance Reason, Start Date/Time, and End Date/Time. 3. Librarian clicks Apply Maintenance. 4. System checks if any existing bookings fall within the maintenance window. 5. System flags the room as Under Maintenance for the period. 6. 7. System updates room status in the search database. 8. System displays confirmation alert.
Alternative flows	A1 (at step 4): Handle Conflicting Bookings 1. System identifies 2 pending/approved student bookings during the maintenance time. 2. System updates those booking statuses to Cancelled by Library. 3. System triggers Email Notification Service to email affected students with the maintenance reason and prompt them to rebook.
Exception flows	E1 (at step 3): Invalid Date Range 1. End time is set before Start time. 2. System shows error: "End date must be after Start date."
Business rules	BR-06

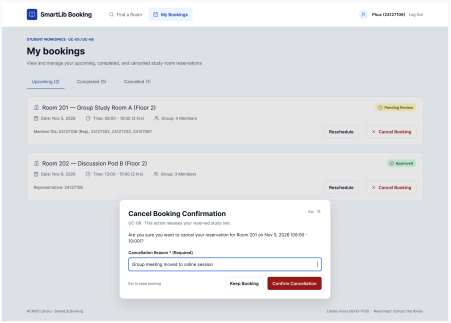

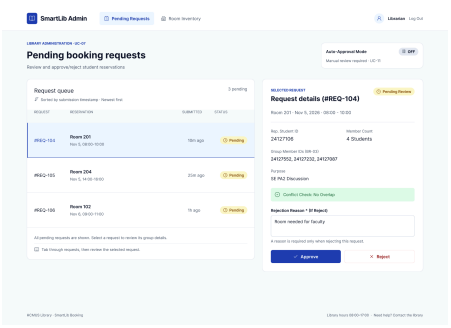

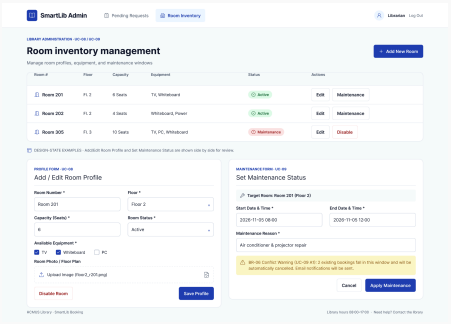

Non-functional constraints	Cancellation emails to affected users must be queued within 1 hour.

8 Prototype / Mockups

Figma Design Workspace:

Screen ID	Screen Name	Related use case(s)	Mockup / link
SCR-01	Central Login Page	**UC-01 (Log In)**	
SCR-02	Find a Room (Search Dashboard)	**UC-02 (Search Available Rooms)**	
SCR-03	Room Booking & Conflict Check Modal	**UC-03 (Book Room), UC-04 (Check Booking Conflict)**	

SCR-04	My Bookings & Cancellation Modal	**UC-05 (View My Bookings), UC-06 (Cancel Booking)**	
SCR-05	Pending Booking Requests Queue	**UC-07 (Review Booking Request)**	
SCR-06	Room Inventory & Maintenance Management	**UC-08 (Manage Room Profiles), UC-09 (Set Room Maintenance Status)**	

9 Requirements Traceability Matrix

Req. ID	Use case	Screen	Design element (PA3)	Test cases (PA4)
FR-01	UC-01	SCR-01: Central Login Page	TBD	TBD
FR-02	UC-02	SCR-02: Find a Room (Search Dashboard)	TBD	TBD
FR-03	UC-03	SCR-03: Room Booking & Conflict Check Modal	TBD	TBD
FR-04	UC-04	SCR-03: Room Booking & Conflict Check Modal	TBD	TBD
FR-05	UC-05	SCR-04: My Bookings & Cancellation Modal	TBD	TBD
FR-06	UC-06	SCR-04: My Bookings & Cancellation Modal	TBD	TBD
FR-07	UC-07	SCR-05: Pending Booking Requests Queue	TBD	TBD
FR-08	UC-08	SCR-06: Room Inventory & Maintenance Management	TBD	TBD
FR-09	UC-09	SCR-06: Room Inventory & Maintenance Management	TBD	TBD
FR-10	UC-10	SCR-04: My Bookings & Cancellation Modal	TBD	TBD
FR-11	UC-11	TBD	TBD	TBD
FR-12	UC-12	SCR-03: Room Booking & Conflict Check Modal	TBD	TBD
FR-13	UC-13	TBD	TBD	TBD
FR-14	UC-14	TBD	TBD	TBD
FR-15	UC-15	TBD	TBD	TBD

FR-16	UC-16	TBD	TBD	TBD

Notes:

- TBD: To Be Determined. Design elements and test cases will be added in PA3 and PA4, respectively.

10 Requirements Review

A requirements review meeting was held prior to the submission of PA2.

- Review Date: November 3, 2026.
- Participants: All team members
- Outcome: All identified issues were discussed, resolved and add to baseline version of the SRS document.

#	Issue found	Requirement(s)	Resolution
1	Unclear Handling of Pre-existing Bookings during Maintenance: The initial spec did not detail what happens to approved student bookings when a room is set to Under Maintenance by staff	FR-09, BR-06, UC-09	Added BR-06 and updated UC-09 Main/Alternative flows: setting a room to maintenance automatically cancels conflicting student bookings and queues notification emails.
2	Missing Mandatory Group Member ID: Booking specifications initially only required the representative student's ID.	FR-03, BR-03, AC-F01-03	Updated BR-03, UC-03, and AC-F01-03 to make Individual Student IDs of all group members a mandatory field for form submission.

11 AI Usage Log

#	Member	Tool	Task / purpose	How the output was verified and changed
1	Nguyễn Võ Nhật Thuận	Gemini	Draft Acceptance Criteria in section 5.4 ,using the Given/When/Then method for Must-have features.	Verified scenarios against project scope; ensured constraints alignment with business rules BR-01 to BR-06 (quotas, non-overlapping slots, mandatory fields, and auto-cancellation).
2	Nguyễn Võ Nhật Thuận	Gemini	Draft Use Case Specifications in section 7 for all 9 Must-have Use Cases from UC-01 to UC-09 following the PA2 specification template.	Cross-checked Use Case IDs and names, and FR against the SmartLib use case diagram; verified pre-conditions, main flows, alternative flows, exception flows, and business rule mappings matched project requirements.
3	Dương Nguyên Nam	Claude	Drafted Section 6 (Use Case Model): the use case diagram as a draw.io file, the actor table and the use case list with MoSCoW priorities.	Checked each use case against the PA1 features F01 to F05 and the problem statement. Redraw and re-laid out the diagram in draw.io. Removed the abstract "Library User" actor and its generalization arrows, and connected Student and Librarian directly to the shared use cases. Changed UC-16 priority from Could to Should. Renumbered the related FR IDs to match Section 5.1.
4	Dương Nguyên Nam	Claude	Drafted Section 4, keeping the five stakeholders from PA1 and linking their interests to the use cases and business rules in this SRS.	Checked that the stakeholder names and order match PA1 Section 2.3. Verified every UC and BR reference against Sections 5.3, 6 and 7.
5	Lai Phạm Như Phúc	Gemini	Plan screen consolidation, ASCII wireframe layouts, and accessibility checklist (contrast, labels, keyboard focus) for Section 8 Prototype / Mockups covering UC-01 to UC-09.	Verified screen flows against all 9 Must-have use case specifications and Business Rules (BR-01 to BR-06). Manually designed the UI mockups and interactive prototype connections in Figma, verified WCAG contrast ratios, and replaced text wireframes with actual Figma screenshots.

6	Lê Phụng Sơn	Gemini	Drafted the SRS Introduction, including Purpose and Scope and Glossary, based on the SmartLib Booking project requirements.	Cross-checked the purpose, scope, and terminology against PA1 to ensure they reflected the documented system features and used consistent terms. Removed unsupported details.
7	Lê Phụng Sơn	Gemini	Drafted Functional Requirements (FRs) and Non-Functional Requirements (NFRs) for the SRS.	Verified the FRs against the vision and proposed solution sections in PA1. Checked NFRs against the documented performance, consistency, reliability, and notification constraints.
8	Trần Hoàng Khánh My	ChatGPT	Draft Problem Statement in Section 3, elaborating the preliminary problem statement from PA1, including business context, current problems, goals, operating environment, and implementation constraints.	Cross-checked the content against PA0 and PA1; refined the problem description and ensured consistency with SmartLib Booking's scope, technology stack, and business rules defined in PA2.
